

Weekly test

1.What are Linux file permissions?

The Linux file permissions are

Read (r) in numerical **(4)**

Write(w) in numerical **(2)**

Execute(x) in numerical **(1)**

Ls -l is the command to check the file permissions.

2.How do you check the disk usage in Linux?

du -h is the command to check the disk usage in linux.

df -h is the command to check the disk free space in linux.

3.what is the difference between Linux and Windows?

Linux is a open source and it is mostly free.

Windows is a closed source and it is paid.

Linux is mostly used because its very secure.

4.what is the difference between CP and mv ?

Cp is used to copy the file or dir.

Ex: cp sourcefile destinationfile === cp file1 file2

Mv is used to move the fir or dir and also used to for renaming.

Ex: mv oldfile newfile === mv unix linux

5.A developer needs read-only access to a file?which permission should be assigned?

Chmod 400 filename (or) chmod u=r filename

6.What are cloud service models?

Infrastructure as a service(IAAS)

Platform as a service(PAAS)

Software as a service(SAAS).

7.what is the difference between EBS and EFS?

EBS: Elastic block storage it is persistence storage it is used for storage.

EBS is availability zone specific and it can't be attached to instance in another region.

1 EBS volume can't attached to multiple servers.

Multiple EBS volumes can be attached to single server.

EFS: Elastic file system it uses the nfs protocol.

EFS can be attached to multiple servers you can access the data from multiple servers.

If you create files or dir in one server you can access those files or dirs from another server.

8.Can EBS volume can be attached to multiple servers?

No we can't attach single EBS volume to multiple servers.

9.which protocol does EFS uses?

EFS uses NFS protocol.

10. you have a web application with 2 EC2 instances.Both servers need to access the same files.which storage service we choose?

Elastic File System(EFS)

If you create files or dir in one server you can access those files or dirs from another server.

11.What is VPC in AWS?

VPC is a Virtual private cloud it is used for security purposes in servers.

VPC consists of public and private subnets, internet gateway, NAT gateway, route tables.

12.what is the difference between public and private subnets?

The subnet which is connected to internet gateway and publicly accessible through internet is called public subnet.

The subnet which is not accessible from the internet is private subnet.

13.your web application should be accessible from the internet,but your database should not be accessible public.How would you design the VPC?

Place the NAT gateway in public subnet. NAT gateway will be used for communicating the database in the private subnet will communicate with the internet.

14.Users cannot access your website even through the EC2 instance is running. which VPC components would you check?

Check whether that server is in public subnet or private subnet.

If the server is in private subnet users cannot access the website.

Also check the route tables.

15.What are cloud deployment models?

Public cloud

Private cloud

Hybrid cloud

Community cloud
